# 1. General Information

# 1.1 Purpose of the manual

This operator manual was issued by NSK Dental Italy to provide the operator with the necessary information for:

- proper installation
- appropriate and safe use
- careful maintenance

The manual is an integral part of the iClave steam sterilizer, hereafter referred to in this manual as the "sterilizer" or, more simply, the "device", and must always remain with it and be immediately available. It should always be kept close to the device, in an easily accessible place and protected from environmental agents that could affect its integrity and durability. It should be readily at hand for immediate consultation at any time by operators and maintainers.

Read the manual carefully and understand it fully before installing the device and putting it into service, particularly the instructions given in the chapter on "Safety information", which are aimed at preventing potential risks that could cause injuries to the operator or damage to the device.

The company that uses the devices is responsible for always ensuring that all operators fully understand the operating instructions.

NSK Dental Italy declines any responsibility for failure to observe the safety and prevention rules described in the various sections of this manual and for damages caused by improper installation and use of the device.

All rights are reserved.

This publication may not be reproduced, transmitted, transcribed, stored in computer systems or translated into another language or computer language, even partially, in any form or by any means without prior written permission from NSK Dental Italy.

NSK Dental Italy reserves the right to make changes to the technical characteristics of the product described in this manual at any time, with no obligation of prior notice or communication.

# 1.2 Criteria for use of the manual and finding information

The information and instructions are collected and organized into chapters and paragraphs, and can be easily found by searching the index.

Information preceded by a warning sign must be read carefully.

Basic information for the health and safety of operators/maintenance personnel is contained in a box marked with warning signs on a coloured background, as illustrated below.

### Safety instructions are classified as follows, in accordance with the seriousness of the risk:

Classification	Risk level
	Information on general product specifications highlighted to prevent malfunctions and loss of product performance.
	Indicates cases where failure to follow the safety instructions may lead to minor or considerable injury to people or damage to the device.
	Indicates cases where failure to follow the safety instructions may lead to serious injury to people or damage to the device.

# 1.3 Professional user profiles

European regulations on safety and the sterilization process describe the following professional roles:

OPERATOR: a person who uses the device for the intended purpose on a daily basis. The operators who use the sterilizer daily are represented by qualified medical personnel:

- Doctor;
- Dental surgeon;
- Implantologist;
- Hygienist.
- Dental assistant

MAINTAINER: a person assigned to the ordinary maintenance of the device on a daily basis. Note: the operator and maintenance technician may also be the same person.

TECHNICIAN: a person assigned to the extraordinary maintenance of the device. It is the person authorized to perform all electrical and mechanical interventions, adjustments and repairs.

RESPONSIBLE AUTHORITY: an individual (often the employer) or group of people responsible for the use and maintenance of the device, who ensures that:

• the operator and maintenance technician are adequately trained to use the device in full safety;

the operator is adequately trained on hygiene and sterilization practices used in the dental field;

• regular training is provided for all personnel regarding the operation and maintenance of the device, including emergency procedures in the event of emission of toxic, flammable, explosive or pathogenic material into the environment;

• registration documents for attendance of the training are preserved and its full understanding is verified;

• a written, electronic or paper record is kept of the sterilization procedures carried out from the moment the device is installed.

Note: Any serious accident occurring with the device must be reported to the Manufacturer and to the competent authority of the Member State where the accident occurred.

Please report incidents, near misses and product malfunctions to the NSK Dental Italy customer care office at: servicesterilization@nsk-italy.it.

# 1.4 Conformity to European Directives

As reported in the declaration of conformity Mod.444-003, drawn up in compliance with Article 19 Annex IV of the regulation 2017/745/EU, the iClave sterilizer manufactured by NSK Dental Italy meets the essential requirements defined by 2017/745/EU Regulation for medical devices, according to which it is classified in class IIa. It also complies with the Directives 2014/68/EC for pressure vessels (PED), 2014/30/EU (Directive Electromagnetic Compatibility) and 2014/35/EU (Directive Low Voltage).

The iClave sterilizer also complies with the reference technical standards EN 13060, IEC 61010-1, IEC 61010-2-40 and IEC 61326-1.

The declaration of conformity is a printed accompanying document in paper format.

This NSK product has been designed and manufactured with high quality materials and parts that can be recycled and reused.

Separate disposal of electrical and electronic equipment, in accordance with Directive 2012/19/UE (WEEE/RAEE). The equipment belongs to Category 8 (medical equipment).

CE Mark and Notified Body number. The CE mark indicates that the device satisfies the essential requirements of the Medical Devices Regulatory (UE) 2017/745.

Notified Body: TÜV SÜD Product Service GmbH, Zertifizierstelle, Ridlerstraße 65, 80339 München – Germany., Identification N. 0123.

# 1.5 Warranty

NSK products are guaranteed against manufacturing errors and defective materials. NSK Dental Italy reserves the right to examine and determine the cause of any problem. The warranty will be void if the product has not been used properly or for its intended use, if it has been tampered with by unqualified personnel or fitted with non-original NSK Dental Italy parts. Replacement parts are available for ten years after production of the model has ceased.

Failure to follow the guidelines given below will void the warranty and/or make the device dangerous to operate.

- In the event of faults and/or malfunction, follow the guidelines given in paragraph 6.3 "Notice list" and paragraph 6.4 "Alarms list". If the problem persists, do not attempt to operate the device but contact the NSK Dental Italy technical support: NSK Dental Italy, Via dell'Agricoltura 21, 36016 Thiene (VI), email address: servicesterilization@nsk-italy.it
- Do not operate the device until the necessary repairs have been made to restore its proper operation.
- Do not attempt to disassemble the device, replace faulty or damaged components and/or have it adjusted or repaired by personnel without proper training and authorization from NSK Dental Italy.
- Faulty or damaged components should only be replaced with original NSK Dental Italy parts.

The warranty is valid for 24 months from the date of sale of the device for any manufacturing errors or material defects. The effective date of the guarantee is determined by the date of the invoice for the purchase of the appliance. NSK Dental Italy reserves the right to analyze and establish the cause of any problem.

The warranty does not cover:

- Damages related to normal wear, improper use, neglect, non-compliance with instructions for use
- Breakdowns due to natural disasters or fires;
- Damage due to improper interventions or repairs not authorized by NSK Dental Italy;
- Damage due to tampering by unqualified personnel;
- Anomalies deriving from parts or materials that are not original, therefore causes not attributable to the manufacturer.

The warranty is also void if:

- The equipment shows damages caused by falling, by exposure to flames or in any case by causes not linked to manufacturing defects;
- There was an incorrect installation;
- There has been an incorrect connection to the electrical network (wrong nominal power supply voltage);
- The serial number has been removed, erased or altered.

Please note that opening the equipment by personnel NOT AUTHORIZED by the manufacturer entails the expiry of the warranty rights and the RESPONSIBILITY of the CE certification.

# 2. Safety information

# 2.1 General safety information

To maintain a maximum level of device safety for patients and specialized professional operators, it is essential that:

- the operators and maintenance technicians have read and understood the instructions for installation and use of the device
- the periodic maintenance operations described in the chapter 7 "Maintenance" are carried out
- the following safety instructions are observed:

### 

- Ensure that the device is connected to a power socket with a protective earth connection.
- Keep the plug in the socket until the sterilization is finished and do not use the socket for other devices at the same time.
- Use only original NSK Dental Italy power cables, as other cables can cause electric shock, fires or damage to the device.
- Do not turn the power on or off unless strictly necessary, as this may trip the fuse.
- Do not touch the power cord with wet hands as this may cause electric shock.
- Install the product with sufficient space to allow immediate removal of the electrical plug.
- Turn off the power switch and disconnect the power cord before performing any maintenance.
- Do not connect non-original NSK Dental Italy accessories or equipment to the device.
- Keep explosive substances and flammable materials far from the device.
- If the device overheats or emits a bad smell, turn off the power switch immediately, remove the plug from the electrical socket and contact technical support.
- Do not allow water or disinfectant liquid to enter the inside of the device as it may cause a short circuit and electrical shock.
- Avoid inadvertently touching the door or the area around the chamber while the device is in operation or immediately after stopping the product, as these reach high temperatures and can cause burns.
- Do not obstruct or cover the steam outlet on the product with other objects. In addition, avoid inadvertently placing your face or hands near the steam outlet, as this can cause burns.
- Only use NSK Dental Italy original components and spare parts.
- Use tape indicators to verify whether an item was successfully sterilised.

### 

- The device must only be installed in enclosed environments.
- Install the machine on a flat surface.
- Do not sterilize liquids or objects other than medical instruments reported in the intended use.
- Avoid any impact on the device. Do not drop the device.
- Wash and dry objects before sterilization. Chemical detergent residues in the chamber can cause corrosion or leave bad odours on sterilized objects.
- Insert the objects to be sterilized using the racks. Directly inserting objects into the chamber may cause sterilization problems, discolouration or even damage to the objects.
- Ensure that any water has been drained before moving the device.
- Use a container or case for sterilizing fine-pointed objects, as these may protrude from the bottom of the rack.
- Sterilize the instruments in accordance with the parameters recommended by the manufacturer or retailer.
- If any irregularities are noticed during use, stop the sterilization cycle and contact technical support.
- Conduct periodic diagnostic checks and routine maintenance operations.
- If the device has not been used for a long time, check that it is working properly before use.
- Portable and mobile RF communication devices can interfere with the device.
- The device must not be used near or above another device. If this is not possible, ensure that all devices work properly.
- The device may malfunction if used near electromagnetic interference. Do not install the device
  near other equipment that emits magnetic waves. Turn off the power if an ultrasonic oscillation or
  electrosurgery device is located near the site of use.
- It is the responsability of the user to fill the autoclave with clean demineralised water in compliance with the EN 13060 standard, free from contaminants and other pathogens.

9

# 2.2 Safety and protection features on the device

The sterilizer has several devices, listed below, that ensure the total safety of operators.

### 2.2.1 Soft-close door with double safety

An electromechanical device allows the door to be opened only under the following conditions:

- device plugged in and switched on
- no alarms activated

• internal pressure not hazardous to the operator (Ambient pressure ±15mbar)

For additional safety, the Unlock button on display must be pressed to unlock the door at the end of a cycle.

If the device is switched off with the door open, do not try to close the door by forcing the handle. To close the door, simply turn the device on again using the main switch.

### 2.2.2 Overpressure protection - safety valve and pressure sensor

### Safety valve

This is a valve located on the back of the device that is triggered when the pressure inside the chamber exceeds 2.6 bar. To check that valve is working properly, switch the device off and allow it to cool down, then unscrew the black cap, pull it slightly until a "click" is heard and then check that it moves freely. The safety valve requires no adjustment or maintenance.

### **Pressure sensor**

This is triggered when the pressure inside the sterilization chamber exceeds 2.4 bar; an acoustic signal alerts the operator and the message A75 appears on the display.

### 2.2.3 Blackout protection

In the event of a power supply failure during the sterilization cycle, the pressure in the chamber is completely released and brought down to ambience level. When the power supply returns, the message A70 appears on the display.

### 2.2.4 Overheating Protection

The temperature inside the sterilization chamber is programmed to not exceed a limit of 142 °C; in the event of failure, additional protection is provided to prevent the temperature from rising above 150 °C.

### 2.2.5 Automatic power off

Thirty minutes after the end of the cycle, unless the door has been opened or a button pressed on the front panel, the device automatically switches off.

This function is not implemented if no sterilization cycle has been run.

# Safety information

# 2.3 Safety signs on the device

The following warning and hazard signs are located on the sterilizer in the positions indicated.

# 2.4 Residual risks

The sterilization process works by means of pressurized steam at high temperature. When removing a load from the sterilization chamber, always use suitable tools and personal protective equipment for handling the hot racks and tools.

When opening the sterilizer door, particularly during a cycle failure, a small quantity of steam or hot condensate may be released; open the door with caution.

During normal daily use of the device, residual heat risks persist in the areas marked with special warning signs, as shown in the figure. Avoid direct contact of body parts with these surfaces.

# 2.5 Bacteriological risks

- If the sterilization cycle is not completed, the load, the trays and their restraint system, as well as the inside of the chamber, should always be considered as potentially contaminated until a subsequent sterilization cycle has been successfully completed.
- The water in the recovery tank should be considered as contaminated, therefore necessary precaution should be taken when emptying the tank. Check the integrity of the drain hose before using it.
- To avoid cross-contamination, wear a new pair of sterile gloves for each task. Take particular care to replace the sterile gloves when loading or unloading instruments from the sterilization chamber and during maintenance operations.
- The use of contaminated water may involve residual risks. It is the responsibility of the user to fill the autoclave with clean demineralised water, free from contaminants and other pathogens. For the water quality see chapter 5.9.3.

# 3. Characteristics

# 3.1 Description of the sterilizer

The iClave is a table-top steam sterilizer designed for the sterilization of dental and medical products and equipment, in accordance with the requirements of standard EN 13060.

It consists of an airtight stainless steel sterilization chamber accessed through a front door; it is protected by an external shock-resistant moulded plastic body and equipped with protective devices that allow operators to use it in full safety. The sterilization cycles are started from the operator touch-screen controlpanel on the front of the device, beside the door.

A detailed description of the units that make up the sterilizer and the components supplied is given in the following paragraphs.

# 3.2 Intended use

Small steam sterilizer used to sterilize medical devices or for materials that are likely to come into contact with blood or body fluids, according to requirements of EN 13060:2014+A1:2018 it is suitable for following sterilization cycle types and loads:

### **Class B sterilization**

Sterilization of solid products, porous products and lumen devices, wrapped or non-wrapped as represented by the test loads.

### **Class S sterilization**

Sterilization of non-wrapped solid products.

Sterilizing instruments unsuitable for this process may expose the operator to risk, cause damage to the sterilizer and compromise its safety devices.

Always check the manufacturer's label to ensure that products are suitable for sterilization. The device is not suitable for the sterilization of liquids and flammable materials. Do not use the device in the presence of anaesthetic or flammable gases.

The room where the device is installed should be adequately ventilated to prevent excessive humidity. Any possible condensation is collected in the small drip tray.

# 3.3 Environmental conditions

The sterilizer is designed to operate in medical locations (e.g. Dental practices, dental and medical clinics, hospitals) with following environmental conditions:

- temperatures between 5°C and 40°C;
- maximum relative humidity of 80% with environmental temperature until 32°C and linearly decrease until 50% in case of environmental temperature until 40°C;
- air pressure between 750 mBar and 1050 mBar;
- altitude between 0 and +2000 meters above sea level.

Transport and storage conditions: temperature -10°C÷50°C, humidity without condensation 10÷95%, air pressure 50÷106 kPa.

Safety valve intervention pressure [2]	2,6 bar

[1] Classification of the device with respect to the ingress of liquids (second digit of the IP20 degree, or 0), and protection from dangerous parts or against the access of solid foreign bodies (first digit of the IP20 degree, or 2).

The first characteristic digit indicates that:

2 - Degree that the casing provides for the protection of people against access to dangerous parts (finger of test), preventing or limiting the penetration of a body part or a contested tool into the casing by a person (test gauge with a diameter of 12 mm) and at the same time the degree that the casing provides for the protection of the equipment against the penetration of solid foreign bodies (test sphere of diameter 12.5 mm);

The second characteristic figure indicates the degree of protection of the casing against harmful effects on the equipment due to the penetration of liquids into the casing. 0 - no protection

[2] Pressurized container conforming to Directive 2014/68/UE (PED)

# 3.9 Labels and symbols

### 3.9.1 Labels present on the back of the sterilizer

There are 2 labels which are fixed in the back of the sterilizer: the serial number label and the UDI label. These labels contain, in addition to the CE marking, important data for operation, already indicated in the technical data table, and the serial number.

### 3.9.2 Labels and symbols present on the packaging

The sterilizer packaging contains printed symbols that represent the storage correct conditions, while during the autoclave packing a label is glued which contains all autoclave information.

### 3.9.3 Symbols legend

	Symbol	Description
		Symbol for manufacturer.
1	NSK	
2	MADE IN ITALY	product is designed, produced and packaged entirely in Italy.
3		Symbol for manufacturer. The data given next to this symbol identifies the manufacturer. NOTE: this symbol must be accompanied by the name and address of the manufacturer.
4	NSK Dental Italy S.r.l.	Manufacturer's name.
5	Via dell'Agricoltura 21, 36016 Thiene (VI) IT	Manufacturer's address.
6		Date of manufacture. The date given beside this symbol is the date of manufacture.
7	SN	Serial number.
8	#	Device model.
9	REF	Catalogue number
10	230 V~ 50/60 Hz 2350W	Type of power supply, frequency and Maximum power.
11	11A	Maximum absorbed current.
12		Type of fuses.
13	S.V.P.I. 2,6 bar	Safety valve intervention pressure.
14	Max W.P. 2,35 bar	Maximum work pressure.
15	Max W.T. 135°C	Maximum work temperature.
16	MD	Medical device.
17	CE	The CE marking certifies that the product meets the standards applicable in the EU member states (see declaration of conformity).

18	0123	Identification number of the notified body. Notified body: TÜV SÜD Product Service GmbH, Zertifizierstelle, Ridlerstraße 65, 80339 München – Germany.	
19	EN13445 Ed.2019 Issue 4	Design code for the sterilization chamber.	
20	Fluid Group 2	Fluid classification according with the PED directive.	
21	Risk Category I	Sterilization chamber risk category.	
22	Max. A.P. 2,6 barg	Maximum allowable pressure.	
23	Volume 24L	Sterilization chamber nominal volume.	
24	D.T. 140°C	Sterilization chamber project temperature.	
25	D.P. 2,6 barg	Sterilization chamber project pressure.	
26	Test Pressure 4,3 barg	Idrostatic test pressure.	
27	Ts min +5°C / Ts max +140°C	Chamber Maximum and minimum temperature.	
28		Caution, carefully read the instructions for use before using the device. Attention residual risks.	
29		Symbol for separate waste collection of electrical and electronic devices, in conformity with Directive 2012/19/EU (WEEE).	
30	i	Symbol is used to indicate the need for the user to consult the instructions for use.	
31	UDI	Symbol is used to indicate a vector that contains information about the unique identifier of the device.	
32	** DB10GA0455+72100012*	UDI Barcode: The barcode follows the format HIBCC and is printed with AIDC technology or in the form human readable (HRI).	
33	-10°-+50°	Temperature limit: Indicates the temperature limits to which the medical device can be safely exposed.	

34	95 10	Humidity limitation: Indicates the range of humidity to which the medical device can be safely exposed.
35		Atmospheric pressure limitation: Indicates the range of atmospheric pressure to which the medical device can be safely exposed.
36		Fragile, handle with care: Indicates a medical device that can be broken or damaged if not handled carefully.
37		Keep away from sunlight: Indicates a medical device that needs protection from light sources and from heat.
38		Keep dry: Indicates a medical device that needs to be protected from moisture.
39		This way up: To indicate correct upright position of the transport package.
40		Stacking limit by number: To indicate that the items shall not be vertically stacked beyond 4pieces, either because of the nature of the transport packaging or because of the nature of the items themselves.

# 4. Installation

# 4.1 Unpacking and transport

The packaging of the sterilizer consists of a wooden pallet on which the sterilizer is placed, with adequate protective padding and a corrugated cardboard casing fixed to the pallet with metal staples. Place the package on a level surface free from clutter to facilitate easy opening and safe extraction of the sterilizer.

There may be a small amount of water inside the chamber due to a residue inside the autoclave hydraulic circuit.

- Remove the staples / strapping holding the casing to the pallet.
- Remove the cardboard casing.
- Remove the accessory kit, corner and edge protection from the sterilizer.
- Lift the sterilizer and position it in the place of installation.

Lifting, transporting and positioning the sterilizer in the place of installation should be performed by two people.

It is recommended to keep the packaging in a cool and dry place.

![](_page_22_Picture_12.jpeg)

![](_page_22_Picture_13.jpeg)

# 4.2 Positioning

Check that the power supply voltage to the device matches that one shown on theregulatory label on the rear panel, that the power outlet is designed to supply at least 16A and that it has an earth connection. If the installation makes the main power switch inaccessible, a specially dedicated accessible electrical disconnection switch should be provided.

The manufacturer is not liable for damage to property or persons caused by electrical systems that are unsuitable or have no earth connections.

The device must be installed on a flat surface. If the support surface is perfectly horizontal, the front feet are already adjusted with a slight inclination to facilitate the flow of water during draining.

If the support surface is not perfectly level, adjust the front legs, raising or lowering them to obtain a slight inclination, as shown in the figure.

Do not place the device on a fragile surface that could be damaged or cause fire or smoke if hot objects fall.

For proper operation, leave a free space of at least 5 cm between the rear of the device and any wall.

Do not install the device near heat sources or in damp or poorly ventilated spaces. The room must provide air circulation with at least 10 air changes per hour; a recirculating air ventilation system (e.g., an electric fan) cannot be used as an alternative.

The safety valve is on the rear of the device. When triggered by excess pressure, it releases very hot steam into the environment. Position the device to avoid risk of burns to the operator.

![](_page_23_Figure_11.jpeg)

![](_page_23_Figure_12.jpeg)

![](_page_23_Picture_13.jpeg)

![](_page_23_Picture_14.jpeg)

### Installation

In the case of built-in installation with a shelf above the device, a space of at least 5 cm should be left between the bottom of the shelf and the top of the device.

Place the device on a mobile shelf with a sliding rail extraction system to allow filling of the deionized water tank, positioned on the top.

![](_page_24_Figure_3.jpeg)

For installation inside a cabinet, leave a ventilationspace of at least 5 cm between the bottom of the shelf and the top of the device.

Place the device on a mobile shelf with a sliding rail extraction system to allow filling of the deionized water tank, positioned on the top, and access to the main switch at the back of the device. If the drain pipe under an adjacent sink is used for the drain of the Purity device (optional), place the device at a greater height than the trap to allow proper drainage of the liquids by gravity.

### STERILIZATION CHAMBER LOAD CAPACITY

The trays of varying widths to fit the circular shape of the sterilization chamber allow an increase of loading capacity.

![](_page_24_Figure_8.jpeg)

![](_page_24_Figure_9.jpeg)

# 4.3 Initial start-up

![](_page_25_Picture_2.jpeg)

The following operations must be carried out by qualified and properly trained personnel. Incorrect procedures and settings can jeopardize the quality of sterilization and cause hazards.

- Check that the power supply has the right voltage and plug the power cord into the outlet.
- Switch on the device by the main switch.
- Fill the demineralized water tank up to the maximum level. When the tank is full, the device signals it with an acoustic signal.

![](_page_25_Picture_7.jpeg)

![](_page_25_Picture_8.jpeg)

The use of poor quality demineralized water can leave limestone on the instruments, on the inside of the chamber and on the trays. It is recommended to use demineralised water with a conductivity <15  $\mu$ S/cm in accordance with the EN 13060 standard. Do not use domestic tap water, even if treated with a filter or water softener.

Do not use battery water or other fluids or additives, as these can cause irreversible damage to the device and hazards to the operator.

For daily inactive periods, the main switch can be left in the ON position.

![](_page_25_Picture_13.jpeg)

i

The door remains locked when the device is switched off; if it is still locked when switched on, Press the unlock button in the main menu.

4.7 Info menu

of the device.

# Installation

# 4.4 Home menu

The device has a HOME screen, where you can easily find the main menu of selectable programs and tests (CYLCES and TESTS), the selection of the most used cycles (B UNIVERSAL and VACUUM), the INFO menu (with a quick view of all general information of the device, such as serial number, firmware version and water conductivity) and the SETTINGS menu (to manage the parameters of configuration of the autoclaves, including date and time regulation, language selection, report download, connections with printers and ethernet).

4.5 Cycles menu

The cycle selection procedure starts from the Main Menu by pressing the CYCLES button.

For information on starting and managing a cycle, see chapter 5.

The INFO menu allows to have a quick view of all general information of the device, in this menu all the information relating to the life of the device is available (software version, installation date, completed cycles) and all the enabled / disabled functions

# 4.6 Test menu

The TEST menu allows to select the test cycles to check the performance of the device.

![](_page_26_Picture_9.jpeg)

![](_page_26_Picture_10.jpeg)

![](_page_26_Picture_11.jpeg)

CYCLES

![](_page_26_Picture_13.jpeg)

# Installation

# 4.8 Settings menu

The **SETTINGS** menu allows to manage the settings of the different autoclave options, connections with printers and ethernet.

In this menu you can also manage the storage of reports on the device and all the advanced features relating to maintenance and technical assistance.

•

•

•

### **O**SETTINGS GENERAL $\odot$ 8 OPERATOR ÷ PRINTER ACUUM 놂 CONNECTIONS • REPORT STORAGE $\left[ 0 \right]$ N i MAINTENANCE SETTINGS 8 TECHNICAL ţ

![](_page_27_Picture_5.jpeg)

### 4.8.1 General settings

The **GENERAL** settings menu allows to manage the settings of:

- date/time modification and their format;
- temperature / pressure measure unit;
- language.

The set parameters will also appear in the cycle report.

### 4.8.1.a Date and time modification

Pressing the **DATE / TIME** button you access on the date format menu. In this menu it is possible to select the date format to be displayed.

**Date format modification**: it is possible modify the date format by pressing the **DATE FORMAT** button.

The available formats are as follows:

- DD-MM-YYYY;
- MM-DD-YYYY;
- YYYY-MM-DD.

**Date modification**: it is possible modify the date by clicking the **DATE** button. Choose the correct date.

**Time format modification**: It is possible modify the time format by clicking the **TIME FORMAT** button.

The available formats are as follows:

- 24 H;
- 12 H.

**Time modification**: It is possible modify the time by clicking the **TIME** button. Choose the correct time according to your time zone.

![](_page_27_Picture_25.jpeg)

![](_page_28_Picture_1.jpeg)

### 4.8.1.b Pressure and temperature unit modification

Pressing the **UNITS** button you access on the pressure measure unit menu. In this menu it is possible select the pressure and temperature measure unit to be displayed.

**Pressure unit modification**: it is possible modify the pressure unit by clicking the **PRESSURE UNIT** button. The available formats are as follows:

- PSI;
- bar.

**Temperature unit modification**: it is possible modify the temperature unit by clicking the **TEMPERATURE UNIT** button. The available formats are as follows:

- Celsius degrees (°C);
- Fahrenheit degrees (°F).

### 4.8.1.c Performance modification

By pressing the **PERFORMANCE** button you access a menu which it is possible to modify the setting according to the type of use. The available settings are:

**ECONOMY**: dedicated setting for those who perform 1 or 2 cycles a day. The chamber is heated only when a cycle is started, at the end of the cycle the heating is deactivated, minimizing energy consumption. In this mode, as the chamber is not pre-heated, the cycle can last longer and can consume more water.

**AUTO KEEP WARM**: setting indicated for those who perform several cycles per day and/or want to optimize device performance. With this setting the chamber remains heated at an intermediate temperature in waiting to run new cycles. This avoids pre-heating times at each start of the cycle.

![](_page_28_Picture_14.jpeg)

MANUAL KEEP WARM: setting indicated for each type of use.

With this setting, when the device is switched on and at the end of each cycle, a message appears on the display which invites the operator to indicate what he/she intends to do next. When switched on, it asks if you want to run the Vacuum Test (YES / NO), at the end of the cycle it asks if you want to keep the chamber heated (YES / NO). In this case, in based on the expected workload and your needs, you have the option to choose how to optimize the use of the device.

![](_page_28_Picture_17.jpeg)

### 4.8.1.d Language modification

Pressing the **LANGUAGE** button you access on language menu. In this menu it is possible select the language to be visualized. Pressing the **ENTER** button the data is confirmed and the screen return to the general settings menu.

### 4.8.1.e Water Load Modification

Pressing the **WATER LOAD** button you access on the water load menu. In this menu it is possible to activate the automatic water loading mode in presence of an external demineralization system (optional).

Pressing the **ENTER** button the data is confirmed and the screen return to the general settings menu.

![](_page_28_Figure_23.jpeg)

![](_page_29_Picture_1.jpeg)

### 4.8.2 Operator menu

The **OPERATOR** menu allows to manage the operators and modify the operators name, password and the cycles they can use.

### 4.8.2.a Create a new operator

Pressing the green button you access on the new operator menu. In this menu it is possible create a new operator to be selected on autoclave.

In this menu you will have to write the name of the operator, their password and the cycles they can perform.

Pressing the **ADD** button the data is confirmed and the screen returns to the operator menu.

	$\mathcal{B}_+$ NEW OPERATOR	CYCLES SELECTION
^	NAME:	SELECT ALL
John Doe		B UNIVERSAL
$\sim$	PASSWORD:	B PRION
81		B 121
8-	C CYCLES SELECTION	B FAST
		VACUUM
<u> </u>		$\sim$
ţ	← ADD	<b>ENTER</b>

![](_page_29_Picture_9.jpeg)

# 4.8.2.b Modification of an existing operator

Pressing the blue button you access on the operator modification menu. In this menu it is possible to modify an existing operator, than you can modify the operator name, their password and the cycles they can perform.

Pressing the **ENTER** button the data is confirmed and the screen returns to the operator menu.

### 4.8.2.c Delete an existing operator

Pressing the red button you access on the delete operator menu. In this menu it is possible delete an existing operator.

Pressing the **DELETE** button a new window appears to confirm the elimination. Pressing the YES button the data are removed and the screen return to the delete operator menu.

![](_page_29_Figure_16.jpeg)

# Installation

### 4.8.3 Printers menu

Pressing the **PRINTER** button you access on the printer magament menu (if available). In this menu you can manage the internal label, the external printer that generate labels, the printer that generate reports and any reprints.

### 4.8.3.a Activation / Deactivation internal printer

Pressing the **INTERNAL** button you access on the menu for activating or deactivating the internal printer.

Pressing the **ENTER** button the data is confirmed and the screen returns to the printers menu.

### 4.8.3.b Activation / Deactivation label printer

Pressing the **LABEL** button you access on the menu for activating or deactivating the label printer.

Pressing the **ENTER** button the data is confirmed and the screen returns to the printers menu.

### 4.8.3.c Activation / Deactivation report printer

Pressing the **REPORT** button you access on the menu for activating or deactivating the report printer. Pressing the **ENTER** button the data is confirmed and the screen returns to the printers menu.

### 4.8.3.d Re-print the label

Pressing the **RE-PRINT LABEL** button you access on the menu for reprinting label. In this menu it is possible to select the cycle whose labels you want to reprint and the number of labels.

Pressing the ENTER button the data is printed and the screen returns to the printers menu.

![](_page_30_Picture_14.jpeg)

### 4.8.4 Connections menu

Pressing the **CONNECTIONS** button you access on the connections menu. In this menu it is possible to manage the LAN connections. Once the device is wired, through the specific Ethernet socket on the back, select the connection options on dynamic IP (**DYNAMIC IP**) or static (**STATIC IP**). (In **DYNAMIC IP** mode the IP address is assigned automatically).

Pressing the **ENTER** button the data is confirmed and the screen returns to the connections menu.

### 4.8.5 Archiviation report menu

Pressing the **REPORT STORAGE** button you access on the archiviation report. In this menu you can manage the report storage, export the reports to USB stick and format the USB stick.

![](_page_30_Picture_20.jpeg)

![](_page_30_Figure_21.jpeg)

![](_page_31_Picture_1.jpeg)

### 4.8.5.a Export report on usb insertion

Pressing the **ON USB INSERTION** button all reports are exported when a USB key is inserted.

4.8.5.b Export report at the end of cycle

Pressing the **AT END OF CYCLE** button all report are automatically export after the termination of the cycle.

4.8.5.c Format USB Stick

Pressing the **FORMATUSB STICK** button you perform the formatting of the usb stick. Before the procedure is completed, a new menù will appear to confirm the decision. Formatting is recommended when using USB Sticks other than the original NSK ones.

4.8.5.d Export report

Pressing the **EXPORT REPORT** button all reports are exported to a USB stick.

It can take several minutes to download many files.

### 4.8.6 Maintenance menu

Pressing the **MAINTENANCE** menu you access the reset menu of the individual counters for spare parts and inspection during product operation, specifically it refers to the spare parts of the bacteriological filter (**BACTERIOLOGICAL FILTER**), the door gasket (**DOOR GASKET**) and the cycle counter for inspection by a techical service.

To reset the counter, just press the blue button next to the chosen counter and a second screen will appear to confirm the reset. Pressing the **YES** button the counter will be reset and the screen will return to the maintenance menu.

![](_page_31_Figure_14.jpeg)

the reset of the **DOOR GASKET** and **INSPECTION** counter is password protected as it is authorized only by maintainers and technicians.

![](_page_31_Picture_16.jpeg)

### 4.8.7 Technical menu

Pressing the **TECHNICAL** menu you access on the technical menu, reserved exclusively for the maintenance technician.

# 5. Using the sterilizer

# 5.1 Turning the sterilizer on

Turn the sterilizer on using the main switch on the right of the device.

After initialization is complete (see paragraph 4.3 "Initial start-up") the **HOME** screen will appear, showing the main menu setup with buttons.

![](_page_32_Picture_5.jpeg)

- 1. Cycles menu;
- 2. The B Universal cycle;
- 3. Device information;
- 4. Test menu;
- 5. The Vacuum test;
- 6. Settings menu;
- 7. Door Unlock;
- 8. Hot surfaces;
- 9. Used water tank full;
- 10. Fill the clean water tank.

![](_page_32_Picture_16.jpeg)

At this point, the sterilizer is ready to start one of the sterilization cycles (described in the following paragraphs). Arrange the material to be sterilized on the trays, place them in the chamber and close the door. Check that the water tank is full. Otherwise, top up the main tank with demineralised water up to the level.

# 5.2 Opening / closing the door

To open the door it is necessary to first unlock it by pressing on the touch panel and then lift the handle anticlockwise upwards as far as it will go. The handle travel is approximately 130°. The sequence of operations is described in the following images:

![](_page_32_Picture_20.jpeg)

The padlock icon is GREEN: the door is locked, pressing the green icon unlocks the door and the icon will turn ORANGE.

Note: Never try to open the door if the icon has not turned ORANGE. With the door closed, keep the handle in a vertical position.

![](_page_33_Picture_1.jpeg)

Turn the handle and lift it upwards as far as it will go, then pull the door towards you.

Note: The padlock remains ORANGE (door opening is possible) for 60 seconds after which it turns GREEN again, no longer allowing the door to be opened. When necessary, press the green icon again.

Before closing the door, lift the handle all the way, then bring the door close to the front and turn the handle anticlockwise until it reaches the vertical position.

Note1: The door can always be closed, regardless of the colour of the icon, green or orange.

Note2: When a cycle is not being performed, the door can be kept ajar (not closed and locked) by simply leaving the handle in the horizontal position.

# 5.3 Tray arrangement and dimensions

![](_page_33_Figure_8.jpeg)

	iClave 18	iClave 24
1	196x292 mm	196x372 mm
2	214x292 mm	214x372 mm

# 5.4 Daily tests to check the sterilizer's performance

During the testing conducted by the manufacturer, in accordance with the regulations, the sterilizer undergoes thorough calibration tests and verification. These tests guarantee the performance of the device, except in the case of unauthorized repairs, tampering or improper use.

Although the device has an advanced diagnosis and process evaluation system, the operator has the responsibility of ensuring the maintenance of performance standards on a daily basis.

The frequency of these checks is determined locally by the healthcare protocols of the place of installation.

The manufacturer recommends running the following tests daily, in the morning, before using the sterilizer: **Vacuum**, **Helix and Bowie&Dick**, described in detail in the following paragraphs.

# Using the sterilizer

VACUUM

VACUUM

 $(\circ)$ 

SETTINGS

(i)

INFO

✓ TEST

B&D HELIX

### 5.4.1 Vacuum test

![](_page_34_Picture_3.jpeg)

Adhere to national and local guidelines regarding testing frequency.

The purpose of the **Vacuum test** is to ensure that the sterilization chamber is perfectly sealed. The manufacturer recommends running the test at the start of the day, before beginning the daily sterilization cycles.

The Vacuum test is activated with the machine unloaded, in standby mode and at an internal temperature below 40°C, which are the typical conditions of the state of the device at the start of a working day.

- Press the **TEST** button;
- In the Test menù, press the VACUUM button;
- If you want to program the Vacuum cycle, click the blue button highlighted on the screen, otherwise if you want to start the test immediately, press the START button.

The device starts automatically the Vacuum test, which lasts approximately 15 minutes. In case of negative test result, the display turns red, and the alarm code indicating an inadequate chamber condition is displayed (see to the 'Alarms' chapter).

### 5.4.2 Helix test and Bowie & Dick test

The purpose of **Helix test** and **Bowie&Dick test** is to verify the proper penetration of the sterilising steam in the tools contained in the sterilization chamber.

The **Helix test** and **Bowie&Dick test** are activated with the sterilizer switched on. The manufacturer recommends running these tests at the start of the day, before beginning the daily sterilization cycles, but they can be run at any time, with the sterilizer on.

Prepare the sterilizer for a Helix test (e.g. HTS100 class 5 cod. 9900051) or a Bowie&Dick test (e.g. 3MTM COMPLYTM cod. 1300) in accordance with the requirements of the test procedure regulations. The device automatically starts the test program, with a temperature of 134°C, a sterilization time of 3.5 minutes and 3 vacuum phases.

If an undesired **Helix test** or **Bowie & Dick** test is accidentally started, you can stop it by pressing the **STOP** button. The device deletes the test started unintentionally, automatically initiates a procedure to remove the fluids in circulation and places itself in stand-by, ready for use in a normal working cycle.

# 5.5 Preparing the material before sterilization

### 5.5.1 Preliminary operations

All the material to be prepared for sterilization is normally contaminated.

Before handling or moving contaminated materials or instruments, the following precautions should be taken:

- Wear rubber or latex gloves of suitable thickness and a face mask;
- Wash your hands, with the gloves already on, using a germicidal detergent;
- separate the instruments suitable for sterilization from those that are not;
- do not carry contaminated instruments in your hands, but always use a tray suitable for carrying instruments;
- be very careful of instruments with sharp parts that can puncture normal rubber gloves; in such cases, protect your hands with gloves of sufficient strength;
- once the handling and transfer of the contaminated materials is finished, carefully wash your hands while still wearing the gloves.

35

![](_page_34_Picture_26.jpeg)

### 5.5.2 Treatment of materials and instruments before sterilization

![](_page_35_Picture_2.jpeg)

Failure to clean and remove organic residues from the instruments to be sterilized can affect the sterilization process and cause damage to the instruments and/or the sterilizer.

Clean and process the materials and instruments to be sterilized as indicated in the following points:

- 1. Rinse the instruments thoroughly under running water immediately after using them.
- 2. Divide metal instruments into groups, according to the type of material of they are made (e.g.: brass, aluminium, stainless steel, carbon steel, chrome-plated metal) in order to avoid electrolytic oxidation.
- 3. Perform a preliminary wash with an ultrasonic device that uses a mixture of water and germicidal solution (follow the manufacturer's instructions) or use a washer-disinfector. For best results, use a special detergent for ultrasonic cleaning, with a neutral pH.

![](_page_35_Picture_8.jpeg)

Solutions that contain phenols or quaternary ammonium compounds can cause corrosion to the instruments and the metal parts of the ultrasonic device.

4. After ultrasonic cleaning, rinse the instruments and visually check that all residues have been completely removed; if necessary, repeat the ultrasound cleaning or wash the instruments thoroughly by hand.

![](_page_35_Picture_11.jpeg)

To avoid mineral deposits on the instruments to be treated, use demineralized or distilled water for rinsing. If normal hard tap water is used, the instruments should be thoroughly dried.

- 5. When cleaning handpieces, in addition to the steps described above, run a wash cycle using a device specially designed for cleaning handpieces, which performs thorough internal cleansing together with lubrication.
- 6. For sterilization of porous materials, wash and dry the materials thoroughly before sterilization.

![](_page_35_Picture_15.jpeg)

Ţ

For washing fabrics and porous materials in general, do not use detergent with high concentrations of chlorine and/or phosphates, such as bleach, as it can damage the support and the metal trays inside the chamber during the subsequent sterilization cycle.

# 5.6 Arranging the material on the trays before sterilization

Follow the guidelines below to obtain optimum effectiveness from the sterilization process and to preserve the life of the materials and instruments.

It is required to use chemical and/or microbiological indicators for the qualification of the sterilization process (it is recommended to use class 5 or class 6 indicators according to the ISO 11140-1 standard.

Place a chemical sterilization indicator on each tray to avoid sterilising the same load twice or using unsterilized material. When sterilising wrapped material, place the chemical indicator inside one of the wraps.

- Arrange instruments of different metals, previously separated, on different trays;
- When sterilising instruments made of metal other than stainless steel, place a sheet of sterilization paper between the tray and the instrument to avoid direct contact between the two materials;
- position cutting instruments so that they do not come into contact during the sterilization cycle; if necessary, isolate them with gauze or cotton cloth;
- arrange receptacles and containers (tubes, cups, glasses, etc.) on their sides or in an inverted position as water accumulation must be avoided;
- do not place more instruments on the trays than they can contain; any overloading must be avoided;
- arrange the instruments with sufficient spacing and ensure that they remain separated throughout the sterilization cycle.
- position articulated pieces, such as scissors, in an open position;
- do not stack the trays one above another or in direct contact with the walls of the chamber; always
  use the tray support provided with the sterilizer;
- always use the supplied extraction clamp to insert or remove the trays from the sterilization chamber.

![](_page_36_Picture_10.jpeg)

![](_page_36_Picture_11.jpeg)

# 5.7 Program selection

Depending on the degree of sterilization to be obtained, the operator has various types of programs available, with a class B or class S sterilization cycle, described in the program table. To select the programs, press the corresponding button on the operator panel.

### **PROGRAM TABLE**

	Parameters		s	Proc val	Process value		q	Maximum load*		
Program	Sterilization time	Pre-vacuum phases	Drying time	Cycle clas	Temperature	Pressure	Cycle total tir (with maximum	Type of Loa	iClave 18	iClave 24

\*: Load including trays.

![](_page_38_Picture_3.jpeg)

\*\*The **B Fast** program must be carried out using a single tray, to be placed in the second slot from the bottom. The **S Fast** doesn't guarantee class B sterilization.

After choosing the cycle, a new menu appears on the screen, containing various information. The central box summarizes the main data relating to the chosen cycle (pressure [1], temperature [2], maximum solid load [3] and maximum porous load [4]), while the three buttons located in the upper area allow you to modify the following sterilization process parameters:

- Changing the sterilization time;
- Changing the drying time;
- Cycle start delay.

![](_page_38_Figure_9.jpeg)

![](_page_39_Picture_1.jpeg)

5.7.1 Sterlization time modification

Pressing the highlighted button you access to the sterilization time modification menù.

The minimum acceptable sterilization time is definied according to the cycle and the EN13060 standard (it will not be possible to have shorter sterilization times).

Pressing the **ENTER** button the data is confirmed and the screen return to the cycle start menù.

### 5.7.2 Drying time modification

Pressing the highlighted button you access to the drying time modification menù.

This function is used when the user must minimize the risk of wet load (due to the load itself).

The minimum acceptable drying time is definied according to the cycle and the EN13060 standard (it will not be possible to have shorter drying time).

Pressing the **ENTER** button the data is confirmed and the screen return to the cycle start menù.

5.7.3 Cycle start delay

Pressing the highlighted button you access to the cycle start delay menù. In this menù it is possible select the date and time scheduled for the cycle.

Pressing the **ENTER** button the data is confirmed and the screen return to the cycle start menù.

# 5.8 Running a cycle

Once the desired cycle has been chosen, by pressing the **START** button the device starts the cycle and a new page will appear, where you can monitor various information:

- The current phase (pre-heating, pulsation, sterilization, drying);
- 2. The remaining time of completion of the cycle;
- 3. The pressure in the sterilization chamber;
- 4. The sterilization chamber temperature.
- 5. Cycle number;
- 6. The cycle info.

![](_page_39_Picture_24.jpeg)

# CYCLE IN PROGRESS 1 2 3 4 00:42:26 Q:15bar 134°C 12345 0 STOP

### 5.8.1 Pre-heating phase (1)

The pre-heating phase is the first phase of the sterilization cycle, this phase has the purpose of heating the device to reach the conditions suitable for the subsequent phases of the cycle.

It isn't an active phase and it isn't counted in the cycle time. The duration is however recorded in the report.

### 5.8.2 Pulses phase (2)

In this phase, with a sequence of vacuum pulses and positive pulses, the device removes the air from the chamber making it possible to carry out the sterilization phase.

The **STOP** during this phase leads to an interruption of the cycle according to EN13060.

![](_page_41_Picture_10.jpeg)

# Using the sterilizer

### 5.8.3 Sterilization phase (3)

During the sterilization phase, the temperature and pressure are kept stable for a predefined time in order to carry out the load sterilization process. The **STOP** during this phase leads to an interruption of the cycle according to EN

13060.

![](_page_42_Picture_4.jpeg)

![](_page_42_Picture_5.jpeg)

### 5.8.4 Drying phase (4)

The drying phase begins at the end of the sterilization phase, the duration of which complies with the predefined parameters. At the end of the drying phase it will be possible to unlock the door and remove the load. The **STOP** during this phase does not involve the interruption of the cycle as the sterilization phase is completed.

If starting with a cold machine, the drying time automatically increases by 4 minutes.

### 5.8.5 End of cycle

At the end of the cycle the screen will change color and will indicate if the cycle has finished successfully (green).

Sterilized instruments and the sterilization chamber are very hot.

Remove the trays very carefully using the special tool and without letting parts of the body come into contact with the hot parts.

![](_page_42_Figure_13.jpeg)

To unlock and open the door, press the button with the padlock located under the screen and rotate the handle (see par.5.2). **The selected cycle is finished and the load can be picked up.** 

If a fault occurs during the cycle or an out of tolerance parameter is detected, the screen will turn a different color and the error code that caused the problem will appear (the door will remain locked). To view the error, press the error code that appears on the screen (example in the photo, button A50). After checking the error, press the X button to exit the cycle.

The instruments and sterilization chamber are very hot. There is also the risk of bacteriological contamination.

In the presence of a printer (optional), the microprocessor sends the most significant data of the cycle to the printer to have a detailed report printed on paper with the certification value of the process carried out.

The display now returns to the **HOME** menu.

From this moment the sterilizer is ready to run a new program.

The operator can prepare a new load and start a new sterilization cycle benefiting from a much faster heating time since the chamber is already hot.

![](_page_42_Picture_21.jpeg)

At the end of the sterilization cycle, lubricate the internal mechanisms of any sterilized handpieces, using the appropriate lubricating oil. This operation is useful in not reducing the life of the instrumentation.

# 5.9 Interrupting the programme

If necessary, a running program can be aborted at any time by pressing the **STOP** button.

In case of interruption of the cycle during the drying phase, the load is considered sterilized and it doesn't foresee a restart of the cycle. However, the load may be wet.

- After pressing the STOP button, the device proceeds to release the pressure before allowing the door to be opened for safety reasons. To unlock the door, press the key button.
- Remove the load very carefully and check for the presence of water inside the chamber (it is recommended to replace the bags if the load is wrapped).
- Before refilling the chamber, carefully dry the inside of the sterilization chamber and wait 10 minutes to allow the water to evaporate and completely drain.

The instruments and sterilization chamber are very hot. There is also the risk of bacteriological contamination.

# 5.10 Topping up with demineralized water and draining contaminated water

The hydraulic circuit does not allow the reuse of the steam produced during the sterilization cycle, which is collected in the recovery tank and must be periodically drained.

The normal operating cycle therefore involves gradual emptying of the demineralized water tank and filling of the recovery tank.

With a cold autoclave, high load and minimum clean water level, it may be that the water runs out.

### 5.10.1 Topping up the demineralized water tank

The average water consumption for each sterilization cycle is 650 cc, which means that a full tank allows about 8 cycles.

When the i20 information is activated (see the paragraph 6.2 "Information List") this indicates an insufficient water level in the loading tank.

Top up with demineralized water until the activation of information i21 (see paragraph 5.1). However, do not fill beyond the closing grid in the top input opening.

![](_page_43_Picture_18.jpeg)

When removing the cap, avoid coming into contact with hot parts inside the demineralized water tank.

### 5.10.2 Draining the used water recovery tank

The activation of information i22 (see paragraph 6.2 "Information list") signals an excessive presence of water in the used water tank. Drain the tank by proceeding as follows:

- 1. Place a recovery container with a capacity of at least 6 liters;
- 2. Insert the drain hose into the hose connection on the front of the device;
- 3. Wait for the tank to drain completely;
- 4. Remove the drain hose from the barb fitting.

![](_page_43_Picture_26.jpeg)

![](_page_43_Picture_27.jpeg)

The water in the used water tank should be considered as biologically contaminated, therefore appropriate precautions should be taken if the tank is emptied. Used water must be disposed of in accordance with local or national regulations.

i

The demineralized water tank can also be drained in the same way, if necessary, connecting the tube to the attachment quickly and positioning the selector on clean water.

### 5.10.3 Checking the water quality

To prevent accidental use of poor quality water, the device is equipped with an automatic water quality control system that measures its conductivity. The control system is part of the initial diagnostic tests and comes into operation automatically when the machine is switched on, provided that the device is at room temperature and with a full demineralized water tank.

At the end of the diagnostics, if the measured conductivity value is higher than 15 µS/cm, the notice I23 appears (see par. 6.2 "Information list").

![](_page_44_Picture_8.jpeg)

The negative result of this check doesn't block the operation of the sterilizer; however, it is recommended to replace the demineralized water found to be of non-ideal quality, with a better quality one.

### The following table shows the recommended minimum parameters for the water to be used

Pollutants	Supply water	Condensed
evaporation residue	≤ 10 mg/l	≤ 1,0 mg/l
silicon oxide	≤ 1 mg/l	≤ 0,1 mg/l
iron	≤ 0,2 mg/l	≤ 0,1 mg/l
cadmium	≤ 0,005 mg/l	≤ 0,005 mg/l
lead	≤ 0,05 mg/l	≤ 0,05 mg/l
residues of heavy metals, excluding iron, cadmium and lead	≤ 0,1 mg/l	≤ 0,1 mg/l
chlorine	≤ 2 mg/l	≤ 0,1 mg/l
phosphates	≤ 0,5 mg/l	≤ 0,1 mg/l
Conductivity (at 20°C)	≤ 15 uS/cm	≤ 3 uS/cm
рН	from 5 to 7,5	from 5 to 7
appearance	Colourless, clean without sediment	Colourless, clean without sediment
hardness	≤ 0,02 mmol/l	≤ 0,02 mmol/l

# Using the sterilizer

# 5.11 Connections

### 5.11.1 Internal printer (optional)

The model equipped with an integrated thermal printer, doesn't require any additional installation operations for printing the sterilization cycle.

In correct storage conditions (absence of exposure to direct sunlight and environmental conditions within the limits set out in chapter 3.3), the maintenance time for printing on paper is 10 years.

### 5.11.2 External printer connection

The device can have an integrated printer (optional) but it is also designed for connection to an external printer, to which process data is sent to document and certify that sterilization has been completed. The recommended printer model offered by NSK Dental Italy is coded Ref. **990009**, it's a powerful compact desktop printer that can be connected to the USB port located in the back or front side of the device. In sequence:

- 1. turn on the printer;
- 2. turn on the sterilizer.
- 3. If one or more sterilization parameters exceed the predefined limits, the device automatically goes into an alarm state; the same alarm signal is shown on the printed report.
- 4. If the cycle is completed correctly, it is not necessary to verify that the values are within the limits.

The report is printed automatically during the cycle and will contain the following information:

- date and time of the process;
- serial number of the cycle;
- cycle and parameters selected;
- type of process: sterilization or disinfection;
- start and end times of the sterilization phase;
- time of completion of the drying phase.

In the case of malfunction or interruption of the cycle, the printer will provide the message CYCLE ABORTED - NOT STERILE and will indicate the type of alarm encountered. At the end of the working day, turn the printer off.

To program the print report language, see the chapter 4 on "Setting temperature and pressure measurement units and selecting the language".

The printer can provide labels in barcode form. The barcode contains the following information:

- model
- serial number
- 18-character identification number (serial number + cycle number + date)
- CODE 39 barcode
- cycle name
- cycle number
- user
- cycle date
- cycle outcome

For printer management, refer to par. 4.8.3. "Printers Menu".

### 5.11.3 Archiving on a USB stick (optional)

The sterilizer can archive the sterilization reports on a USB stick as an alternative to printing on paper. To connect, just use the supplied USB key or insert your own key into the USB socket on the front of the autoclave.

For archiving on a USB stick, refer to par. 4.8.5.

Do not connect devices not foreseen by the manufacturer.

1.3
£1

![](_page_45_Figure_37.jpeg)

# 5.12 Cybersecurity

This sterilizer has been designed and manufactured by NSK Dental Italy with the aim of removing, as far as possible, the impairment of performance or the risks associated with possible negative interactions between the device and the IT environment in which it operates, even if the medical device does not patient data is managed or saved, but only cycle reports.

To check the current firmware version use the menu.

To prevent unauthorized use NSK Dental Italy has applied an intrinsically safe design which includes:

- End-to-end (TLS) encrypted data communications are used to keep communications with NSK Cloud confidential.
- Digital signatures are used to preserve integrity. Highly sensitive data, such as firmware updates, are accepted by authenticated end-points.
- Data flows in only one direction from the Ethernet port, the security context must be mutually authenticated, and cryptographic mechanisms, including encryption and signature verification, must be bi-directional.
- Corrections or firmware updates from NSK Dental Italy will be available promptly if needed and should be applied as soon as available. Systematic procedures will be in place for authorized users to download and install updates from NSK Dental Italy once a patch or new firmware is available.
- Full support will be available for users, in case of requests regarding device cybersecurity please write to servicesterilization@nsk-italy.it.

Then, to mitigate the risk of cybersecurity threats:

- the IT network where the device is installed and connected must be appropriate for this medical device (for example, the use of configurations may include end point protections such as antimalware, firewall/firewall rules, whitelisting, security event parameters, logging parameters, physical security detection).
- Only the Ethernet port can be used to communicate with NSK Cloud.
- allow the use of the device only to suitable and adequately authorized personnel
- users must be careful not to spread their pins to enter the technical menu.

# 6. Alarms

# 6.1 Generality

When the device is switched on and during each sterilization cycle, the characteristic parameters of the various phases of the cycle are constantly monitored, together with the proper functioning and acceptable condition of all the components.

Any anomaly or fault is immediately indicated on the display through warning messages and alarm codes, together with an acoustic signal.

The following paragraphs show the possible information, notification and alarm messages in the table:

**INFORMATION**: the information will appear in case of incorrect use or in case of maintenance requested by the operator. These messages normally allow the cycle to start but require certain actions by the operator.

**NOTIFICATIONS**: warnings will appear in case of small malfunctions of the device; this type of malfunction does not cause the sterilization cycle to be interrupted. The cycle will continue until completion but at the end of the cycle it will be necessary to evaluate / solve the problem.

**ALARMS**: the alarms will appear in case of machine malfunctions that affect the sterilization cycle and lead to "Sterilization process failed" according to EN 13060:2014+A1:2018. These malfunctions require the immediate interruption of the process and the procedure for resetting the device. No further cycles can be performed until the cause of the fault is resolved..

The tables show:

- in the first column from the left the encoding of the message;
- in the second column the message shown on the display;
- in the third column the cause of the message;
- in the fourth column the solution to the problem, which in some cases can be solved by the operator, in others technical assistance is required.

![](_page_47_Picture_14.jpeg)

Instruments and sterilization chamber are very hot. Carry out the operations indicated without letting the parts of the body come into contact with hot surfaces.

NR.	DISPLAY MESSAGE	CAUSE	SOLUTION
i01	Replace the bacteriological filter	The bacteriological filter has performed more than 500 cycles.	Replace the bacteriological filter and reset the dedicated counter.
i02	Replace door gasket	The door gasket has performed more than 1000 cycles.	Replace the door gasket and reset the dedicated counter.
i03	Carry out periodic inspection	A year has passed since installation date or more than 1000 cycles have been completed without any maintenance by technical support.	Require a complete check- up by a qualified technical service; contact technical maintenance.
i10	Close the door	Door not closed properly.	Check that the door is closed properly.
i20	Fill the tank	Insufficient water level in the clean water tank.	Fill the clean water tank.
i21	Clean water tank full	The level of the clean water tank has reached the maximum allowed level.	Stop filling the clean water tank.

# 6.2 Informations list

i22	Used water tank full	The used water tank is full.	Empty the used water tank.
i23 Check clean water quality		Conductivity of clean water higher than 15 µS/cm, therefore too high.	Replace or fill the clean water tank with demineralized water.
i30	Wait for cooling	Chamber temperature too high, Vacuum test not possible.	Turn off the device and leave the door open to cool the chamber.
i50	50 Cycle interrupted The cycle was manually interrupted by the operatore. Sterlization is not completed.		Dry the chamber, if wet, and restart the cycle. If it persists, contact technical assistance.
i60	Drying interrupted	The cycle was manually interrupted by the operatore during the drying phase.	Dry the load or use it immediately.

# 6.3 Notification list

NR.	DISPLAY MESSAGE	CAUSE	SOLUTION	
N04	Replace the bacteriological filter	Clogged bacteriological filter.	Replace the bacteriological filter and reset the dedicated counter.	
N05	Clean the drain filter	Clogged drain filter.	Clean or replace the filter under the metal plate at the bottom of the chamber.	
N31	Clean the door gasket	Vacuum test failed. Possible leak in the door gasket.	Clean the door gasket and repeat the test. If it persists, contact technical assistance.	
N32	Vacuum test failed: try again	The expected vacuum value was not reached within the set time.	Dry the chamber, if wet, and restart the cycle. If it persists, contact technical assistance.	
N33	Clean the door gasket	Dual Helix test failed. Possible leak in the door gasket. The pressure has not decreased in the expected time.	Clean the door gasket and repeat the test. Pressure loss. If it persists, contact technical assistance.	
N40	Pre-heating phase too long	Slow heating of the room.	Run the cycle with less load. If the problem persists, contact the techincal assistance. Check the mains voltage.	
N61	Reduce load	The minimum pressure value has not been reached within the set time.	Reduce the load to make drying easier.	
N70	Faulty conductivity meter	Faulty or defective conductivity meter.	Contact technical assistance.

# 7. Maintenance

### 7.1 Ordinary maintenance

Maintenance of the device must be carried out by suitably trained personnel, who have read and understood all the procedures and information given in this instruction manual, particularly in chapter 2 "Safety information".

Always wear sterilized disposable latex gloves.

To ensure maximum life and reliability of the device, it is recommended to perfect the cleaning and washing techniques of the instrumentation.

One of the main causes of premature wear of the sterilizer is given by residues on instruments that are not perfectly clean, with consequent formation of stains, encrustations and progressive obstructions of the filters, of the solenoid valves and of the hydraulic circuit.

The following table shows the routine maintenance that the operator or maintenance technician must perform regularly. It indicates the frequency of the maintenance and describes the type of operation to perform.

Frequency	Type of operation	Operation procedure
Daily	Manual cleaning of the sterilization chamber. This should be done when the chamber is cold.	Cleaning to be done manually using a cloth moistened with demineralized water
Daily	Manual cleaning of the rubber gasket on the door. This should be done when the chamber is cold.	Cleaning to be done manually using a cloth moistened with demineralized water
Monthly or every 100 cycles	H2O filters cleaning (chamber and tank)	See paragraph 7.1.1 and 7.1.2.
Every 5 days of use or during a shutdown equal to or greater than 2 days	Tanks cleaning	Empty both tanks containing inlet and outlet water as described in paragraph 5.9.2. Rinse the tank with clean water to remove any deposits present around the filters and on the bottom. Wipe with a dry cloth inside and clean thoroughly. <b>Do not use cleaning</b> <b>products or detergents inside</b> <b>the tank.</b>
Every 6 months or every 500 cycles	Replacement of the bacteriological filter (code 021008)	See paragraph 7.1.2

### PERIODIC MAINTENANCE TABLE

7.1.1 Demineralized water filter replacement and cleaning

To clean or replace the demineralized water filter, open the tank cup and empty the clean water tank. When the tank is empty, remove the filter from its housing. Clean or replace the filter and re-insert it in its seat, taking care to insert it completely (use your thumb to push the filter as far as it will go).

![](_page_51_Picture_1.jpeg)

7.1.2 H2O chamber filter clean and replacement

To clean or replace the H20 filter in the chamber, it must be ope-

ned the hatch (unlocking it with the appropriate command on the screen) e

unscrewing the filter at the bottom using the key supplied in the autoclave accessories kit.

Pay attention: possible hot surfaces.

### 7.1.3 Replacing the bacteriological filter

**i** Replace the bacteriological filter with the device switched off.

Unscrew the bacteriological filter and replace it with a new one. Install the filter in its housing, taking care to ensure that it is fully screwed in.

![](_page_51_Picture_10.jpeg)

### 7.2 Scheduled maintenance

Pos	Check/activity	Responsible	Frequence
1	Door adjustment		1 Year / 1.000 cycles
	- Gasket replacement	Maintainer / Technician	1 Year / 1.000 cycles
	- Disk-door clearance check	Maintainer / Technician	1 Year / 1.000 cycles
	- Lubrification	Maintainer / Technician	1 Year / 1.000 cycles
	- Component wear check	Maintainer / Technician	1 Year / 1.000 cycles
	- Closing pin replacement (if necessary)	Technician	2 Years / 2.000 cycles
2	Calibration	Maintainer / Technician	1 Year
3	Filter cleaning / replacement		1 Year / 1.000 cycles
	- Chamber cylindrical filter replacement	Operator	1 Year / 1.000 cycles
	- Clean water tank filter replacement	Operator	1 Year / 1.000 cycles
4	Pump feature check	Technician	1 Year / 1.000 cycles
5	Tanks cleaning	Maintainer / Technician	1 Year / 1.000 cycles
6	Radiator cleaning	Maintainer / Technician	1 Year / 1.000 cycles
7	Non-return valve replacement	Technician	2 Years / 2.000 cycles
8	Micropump replacement	Technician	2 Years / 2.000 cycles
9	Electric closing piston check / lubricate	Maintainer / Technician	2 Years / 2.000 cycles
10	Radiator outlet brass filter inspection / cleaning	Maintainer / Technician	2 Years / 2.000 cycles
11	Vacuum Pump Maintenance	Technician	2 Years / 2.000 cycles
NOTE: refer to the legislation and instructions for each individual country.			

The following table indicates the scheduled maintenance operations to be carried out on the device by qualified and authorized personnel at the customer's premises, with the relative deadlines.

### 7.3 Periodic validation / regualification of the sterilization process

The sterilizer purchased complies with the applicable requirements the of parameters set by the manufacturer standards force, and the safety in are designed to ensure the sterility of the load in the conditions indicated in the manual. To ensure process safety over time, it is necessary to check, periodically (1 year), the process parameters (pressure and temperature), making sure that they remain within the limits set by the European reference standards EN 17665. and EN 556. The requalification of the performance of the sterilizer falls under the responsibility of the user of the product. The requalification of the process (as well as extraordinary maintenance) must be carried out by the person identified as a "Technician" who corresponds to qualified and authorized personnel who carry out the operations at the NSK Dental Italy company, if the sterilizer must be returned or collected for repairs to be carried out in the laboratory or in the factory, please remember to accompany the sterilizer with a photocopy of the sales invoice and in case of return of the appropriate RMA authorization which must always be requested in advance before sending the device to the customer office care of NSK Dental Italy.

### 7.4 Fuses replacement

1

The replacement of the fuses must be carried out by the technician, who must have read and understood all the procedures and information contained in this instruction manual, in particular in chapter 2 "Safety information".

To replace the fuses, switch off the device and disconnect the power cable. Unscrew the protection covers of the fuses and replace them with fuses with characteristics equivalent to those provided in the original equipment (see par. 3.8 Technical Data).

### 7.5 Useful life of the device

The average life of the sterilizer in service is 10 years. For normal use, the device is expected to be used and maintained following the instructions provided by NSK Dental Italy.
